

Combining Clinical Phenotypes and DNA Foundation Models to Predict Human Disease

Lucila Ohno-Machado

Waldemar von Zedtwitz Professor of Medicine and Chair,

Department of Biomedical Informatics and Data Science

Deputy Dean for Biomedical Informatics

Yale SCHOOL OF MEDICINE

MIRACUM-DIFUTURE Symposium, Mannheim

6/30/26

Many thanks to the symposium organizers and attendees!

Acknowledging colleagues from the Yale Department of Biomedical Informatics & Data Science (Hua Xu, Daniella Meeker, Rui Zhu, ...), Evo2 developers (Brian Hie et al), data sources, collaborators in various institutions

Reflections

AI in Medicine is not new

Eliza, first chatbot (1966)

Weizenbaum, Joseph "ELIZA – A Computer Program For the Study of Natural Language Communication Between Man and Machine". Communications of the ACM; Volume 9 , Issue 1 (January 1966): p 36-45.

```
ELIZA: You're not really talking about me -- are you ?
YOU:  What?
ELIZA: What do you think ?
YOU:  I mean, I feel happy to be writing right now, to be typing this as we spe
ak.  Lately, I've had writer's block.
ELIZA: You say you mean ?
YOU:  That's what I said.
ELIZA: Can you elaborate on that ?
YOU:  I only really feel happy when I'm writing.
ELIZA: How long have you been writing ?
YOU:  Always, but I've been writing seriously since I was eighteen.
ELIZA: What incident are you thinking of ?
YOU:  Um.
ELIZA: What does that suggest to you ?
YOU:  I don't think it's enough, to only be happy when you write.
ELIZA: Does that trouble you ?
YOU:  ...Um, because you can't write all the time.  And then there's the real w
orld, and you still have to deal with real people.
ELIZA: What are your feelings now ?
YOU:  I've been thinking a lot of that poem by Yeats:  "The Man and the Echo."
Do you know it?
ELIZA: Do you say you've been thinking a lot of that poem by yeats: "the man and
the echo for some special reason ?
YOU:  Yes
```

```
ELIZA: Would it matter to you ?
YOU:  Yes, a lot!
ELIZA: You are sure.
YOU:  Yes, I am sure.
ELIZA: I see.
YOU:  Are you complicated?
ELIZA: Perhaps I am complicated in your fantasies.
YOU:  Indeed
ELIZA: That is interesting. Please continue.
YOU:  On what?
ELIZA: What comes to mind when you ask that ?
YOU:  That you are a bot.
ELIZA: What makes you think I am a bot ?
YOU:  You sound like one.
ELIZA: You're not really talking about me -- are you ?
YOU:  Yes.
ELIZA: I understand.
YOU:  Where were you born?
ELIZA: What suggests that I was born ?
```

Genomics for Everyone

An NHGRI-funded Center of Excellence in Genome Science

Disease risk is influenced by many factors, the more parameters, the more data are needed

The diagram illustrates a regression model for disease risk. A large left bracket groups the trait and the model equation. The trait is defined as 'e.g. LDL, cancer diagnosis'. The model equation is $E[y_i] \sim X_i\beta + Q_i\gamma + C_i\delta$. The genetic determinants are split into 'Variant effects' (SNPs, HLA, TRs,...) and 'Ancestry' (SNPs, PCs,...). The social determinants are listed as 'income, education, diet,...'. An arrow points from the bottom of the bracket to the text 'Algorithms and tools to analyze data that can stay in their enclaves'.

Trait e.g. LDL, cancer diagnosis	Genetic determinants Variant effects SNPs, HLA, TRs,...	Ancestry SNPs, PCs,...	Social determinants income, education, diet,...
---	---	----------------------------------	---

$$E[y_i] \sim X_i\beta + Q_i\gamma + C_i\delta$$

Algorithms and tools to analyze data that can stay in their enclaves

Polygenic Risk Scores (PRS)

PRSs are being produced to assess risk for many diseases

Models need a lot of data

Can we protect privacy?

What to do with individuals from mixed ancestries?

Electronic Health Records (EHRs) for Clinical Studies

- EHRs (and linked data) becomes an enabling resource for Real World Evidence generation

* Real-World Data: Assessing Electronic Health Records and Medical Claims Data To Support Regulatory Decision-Making for Drug and Biological Products – Draft Guidance by FDA, September 2021

Deep learning's imagination problem

Deep learning creates bizarre albeit fascinating images (Source: deepdreamgenerator.com)

Generative Adversarial Networks

Objective

Make fake data
indistinguishable from real data

1. Generator

Produces fake data

2. Discriminator Network

Classifies fake vs. real

Synthetic images produced by StyleGAN, a GAN created by Nvidia researchers.

Generative AI has great potential in medicine, but some important challenges remain

Privacy risks of Gen AI models have not been fully characterized

Models and data are no longer easy to separate

Natural intelligence still needed to make the best use of artificial intelligence

there is no AI free lunch

generate a picture of an AI free lunch at a hospital with patient and doctor

Thank you!
